Condolence to Dr. Geetha Mary Philips on the sad demise of her father K. O. Oommen.

Abstract - November 2007

Pyrexia of Unknown Origin

Dr. P. Ramakrishnan, Dr. Shyamala Menon, Dr. Geetha Philip, Dr. Pavithran, Dr. Jose Francis

Definition

Pyrexia of Unknown Origin (PUO) is one of the knottiest diagnostic problems and variously defined by different authors, over the years, depending on the clinical set up and available facility at that time. The widely accepted definition is one from Petersdorf and Beeson, "fever of more than 101°F (38.3°C) of three weeks duration, undiagnosed after one week's study". In clinical practice in India, the term PUO may be used to denote any fever of more than ten days' duration, undiagnosed after all the basic investigations are performed.

Aetiology

The common causes of PUO are shown below :

Infections : Pulmonary and extra-pulmonary tuberculosis, malaria, typhoid, leptospirosis, visceraleishmaniasis, brucellosis, deep abscesses (liver subphrenic and pelvic), SBE, urinary tract infection, HIV, viral and fungal infections and infection due to implanted or indwelling devices.

Malignant diseases : Lymphomas, leukaemias, solid tumours like hepatoma, renal cell carcinoma, carcinoma pancreas, and carcinoma stomach.

Connective tissue diseases : SLE, rheumatoid arthritis, polyarteritis nodosa, polymyalgia, polymyositis, dermatomyositis.

Miscellaneous : Sarcoidosis, thyroiditis, inflammatory bowel disease, pulmonary thromboembolism, atrial myxomas, factitious fever, injection abscesses.

Drug fever : Amionoglycosides, anti-epileptics, INH, alpramethyldopa.

Changing Pattern of Diseases

In recent years one often sees atypical or changed pattern of clinical presentations of hitherto common ailments. Partially treated patients also have a modified clinical picture.

Extra-pulmonary tuberculosis, falciparum malaria with renal failure, neuro-typhoid, renal typhoid, leptospirosis with DIC and ARDS, infection of implants and catheters are some of the examples.

Approach to a case of PUO

The basic approach to a case of PUO is outlined below :

History : Occupation (leptospirosis); Contact with infection (tuberculosis), animals (brucellosis); Presence of primary / secondary immunocompromised stated; Recent operation or dental treatment; Drug history; Psychiatric history from relatives.

Signs : General examination for evidence of jaundice, anaemia, skin and mucosal lesions and lymphadenopathy; Abdominal examination for organomegaly, masses and ascites; Heart murmurs.

Investigations : Routine blood counts, ESR, blood smear for malarial parasites, urine examination; Blood culture and urine culture; Serology for typhoid, leptospirosis, brucellosis and tuberculosis; Chest X-ray; Ultrasound abdomen; Mantoux test, tests for HIV; Further investigations; Tissue biopsy and bone marrow aspiration, CT, MRI and guided biopsies, ANA anti DNA, Weil-Felix test.

Therapeutic trial : Anti-microbial therapy; anti-tubercular drugs / antibiotics; Corticosteroid therapy.

December 1st, High Court Junction : AIDS Awareness rally in progress

SOCIAL SECURITY SCHEME

Last year 7118 members enrolled in the Social Security scheme and contributed Rs.5,33,850 in Scheme I and in Scheme II, 1523 members enrolled with a contribution of Rs.4,56,900.
